

Veil

Private financing with funded offers
and a complete margin-call lifecycle.

Reserve principal

Manage collateral

Repay and release

No Witness Labs · Two-person build team
Local Canton model · Version 0.5.0

Improve Veil around one complete workflow

- | | | |
|----|-----------------------------|---|
| 01 | A working base | Private offers, repayment, and role views already exist. Our two-person team can focus on the missing risk controls. |
| 02 | Visible new value | Reserve principal, recheck collateral value, issue a timed call, cure it, and close the loan. Judges can follow the whole flow. |
| 03 | A useful review role | The invited team's Canton and audit experience fits authorization, valuation lineage, time boundaries, and privacy review. |

We can build and test the prototype now. An institutional partner helps validate the workflow and define custody, signing, and settlement for a pilot.

Private execution for known counterparties

For lending operations teams financing a known treasury counterparty against tokenized collateral.

Today: our hypothesis

Teams coordinate terms, price checks, margin calls, and settlement across separate systems.

The pain to validate: who owns the current state, what is due, and what each party may see.

With the Veil demo

The ledger enforces the agreed transitions, value checks, deadlines, and contract visibility.

The lender supplies principal; the borrower receives financing and can cure a collateral breach.

Next validation: show the workflow to 3 lending or treasury operators and test whether it matches one real deal. No interviews or willingness-to-pay evidence yet.

A disclosed baseline, a concrete increment

Earlier Veil

Private offers and demo holdings.
Acceptance and repayment.
Role views and an earlier hosted demo.

Earlier maturity work also exists. Season 3 integrates that policy into the new lifecycle.

Baseline: 2455470 · Earlier video and deck remain prior-work artifacts.

This Season 3 increment

Funding: controlled issuer and reserved principal.

Valuation: agreed price stream, freshness, and origination LTV checks.

Risk: timed calls, exact top-ups, recovery, and maturity integration.

Evidence: matching UI, local contract tests, and browser checks.

Merged implementation: PR #36 · PR #38 · PR #39. Scope and attribution: docs/SEASON3.md.

A financial workflow that uses Canton directly

TRACK EXPECTATION	VEIL DEMONSTRATION
A financial MVP	Bilateral collateralized financing with funding and risk controls.
Economic flows	100 principal delivered; 105 repaid; locked collateral returned.
Network activity	Offers, price updates, calls, cures, and closes create ledger transactions.
Target user and GTM	Lender operations first; validate one workflow before a scoped pilot.

Why Canton: contract-level visibility, multi-party authorization, and atomic changes to cash and collateral state.

Track 2 is our proposal. Current activity is local and simulated, not live volume. Track brief: hackathon.appsfactory.cc/season-3.

The lender reserves principal before acceptance

Secured Credit Facility

VALUATION STREAM · 0015A87186...844B30

Agreed valuation agent: Valuer

Margin-call window: 60 seconds

Fund

The normal lender flow consumes cash and reserves 100 in the offer.

Accept or withdraw

Both consume the same offer. Principal is delivered or refunded once.

Explicit issuer trust

The trusted issuer can mint supply and directly authorize offers. It sees holdings and loans.

Actual local 0.5.0 screen. Meridian Capital and Northwind Treasury are fictional demo names. No real asset backing or custody is established.

A price shock becomes a controlled cure

01 / HEALTHY

66.7%

150 units × 1.00

Collateral value: 150

Principal: 100

Offer and acceptance allowed.

02 / BREACHED

107.5%

150 units × 0.62

Collateral value: 93

Threshold: 90%

Lender opens a 60-second call.

03 / CURED

80.6%

200 units × 0.62

Borrower adds exactly 50.

Collateral value: 124

The margin call clears.

Close: repay 105 simulated USDC → lender receives 105 → borrower receives all 200 locked units.

LTV = principal ÷ collateral value. Fixed interest is included in repayment, not LTV. All prices are manually attested demo marks.

Every role has an explicit visibility boundary

ROLE	ACTIVE-CONTRACT VIEW IN THE DEMO
Lender and borrower	Shared deals and marks; each party's own free holdings.
Regulator	Observes deal, settlement, and valuation records.
Valuer	Valuation records and counterparties; no loan or settlement.
Demo issuer	Its holdings and associated offer, loan, and settlement records.
Outsider	Empty active-contract response: []

This is one participant with local authentication disabled. Independent identities, participant privacy, and transaction disclosures still need validation.

The client selects its configured issuer; the raw party query is preserved. Active views do not revoke historical disclosures.

Local behavior is tested; adoption is unvalidated

34 scripts

Daml regression scripts pass, plus shared setup. Production and frontend builds pass.

Full flow

Local Chrome exercised funding, refunds, guarded acceptance, margin, cure, and repayment.

Lifecycle conservation

Between issuance and reset: cash + offer reserves = 205; free + locked collateral = 200.

Remaining proof

External audit, user trials, independent signing, asset integration, and a validated hosted deployment.

Recorded on 404ab01; merged as e25da25 in PR #39. GitHub CI jobs did not start due to a billing lock; owner-authorized merge used local checks. Detail: docs/SEASON3.md.

Challenge the model, then help shape the pilot

01 / Reproduce

Run the three-minute demo and contract tests. Follow the real contract IDs and transaction evidence.

02 / Review

Check issuer trust, fund conservation, valuation lineage, timing races, and disclosure boundaries.

03 / Improve

Bring a better use case or new ideas. Help identify one operator and the smallest useful pilot.

Next pilot requirements: independent signing, an asset/custody integration, a valuation source, and an agreed operating workflow.
